Dell 9010 All-in-One case removal instructions

1. Lay the computer face down, flat on its screen. On the back, look for the square plastic cover immediately above where the base attaches to the computer. Starting at the bottom and working your way up, pry the cover open and then slide it up and off.

2. This will expose four phillips screws that secure the base to the VESA mount. Remove these screws.
3. With the mount screws removed, tilt the base up and then slide it towards you to remove the base.

4. On the bottom of the computer, there are four more screws along the width of the speaker grille. Remove these screws to prepare to open the computer.
5. Starting in the area indicated below, firmly grab the silver exterior casing and lift upwards. This can take a lot of elbow grease! It might help to use your thumbs to apply downward pressure on the thin lip of the speaker grille. With enough force, the back half of the case will separate. Work your way around the case to completely remove the back.

6. Dig in and have fun!
